

NarratorAI

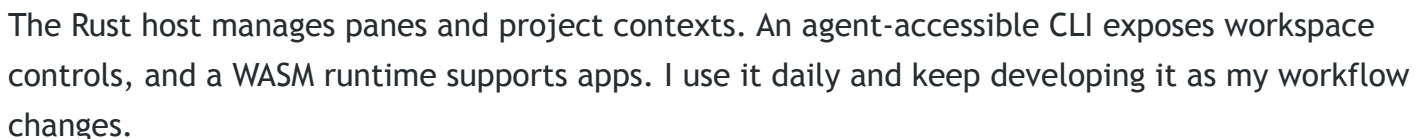

AI media tools for Narrative Ads

An internal application for media production and advertising analytics. The review queue keeps uploads, variants, and review states together.

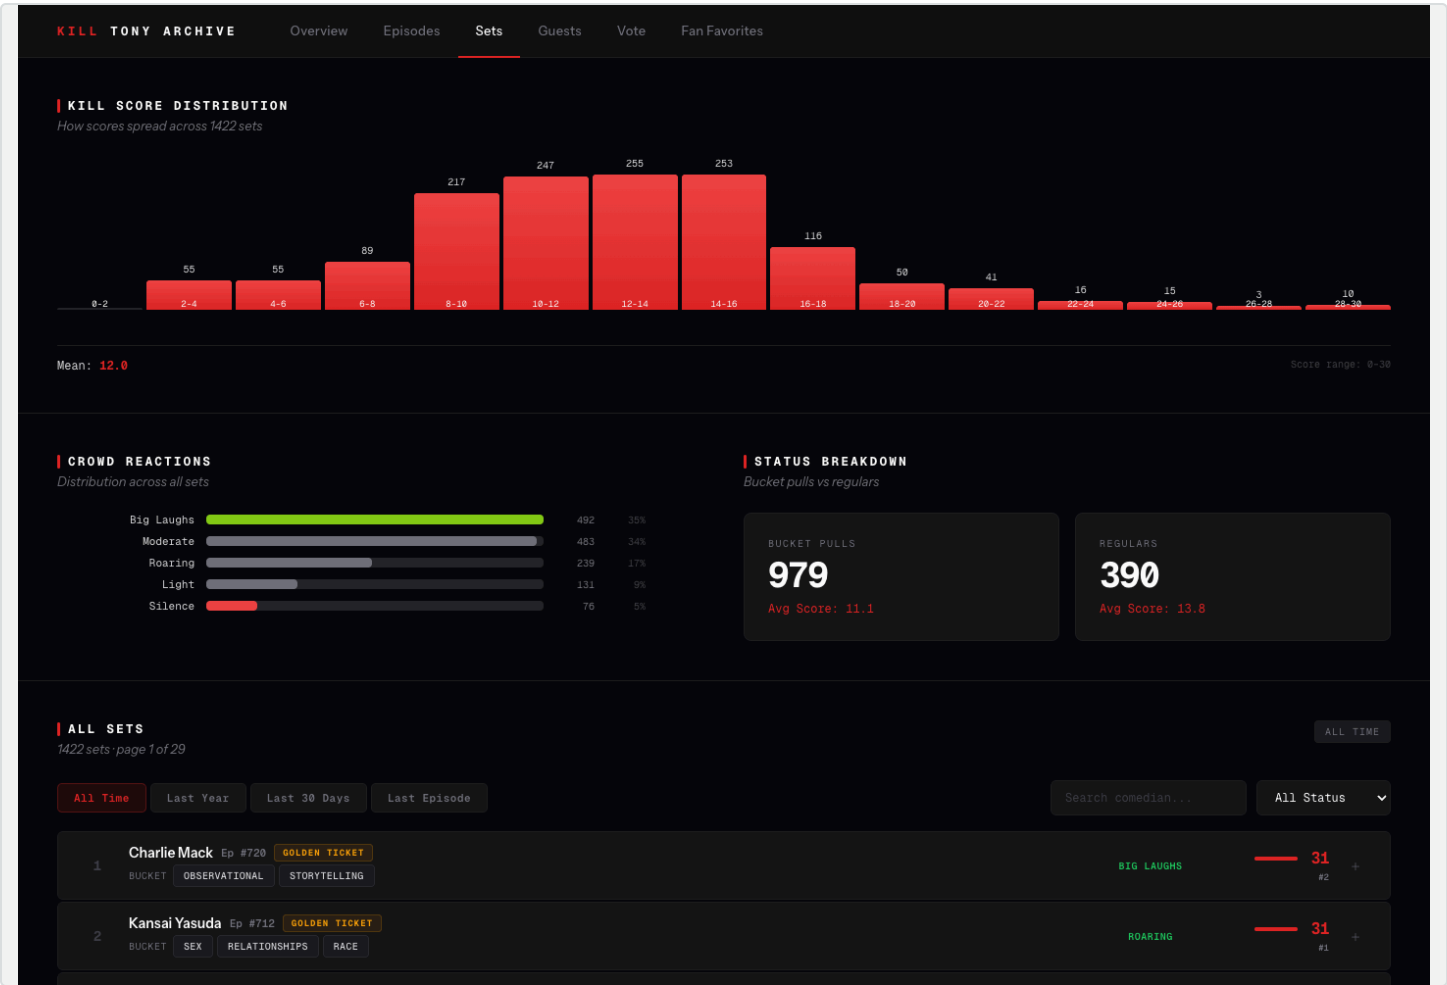

I work across the interface, provider integrations, and cloud backend. That includes image, video, and voiceover workflows, generation-failure investigation, capacity changes, and monthly provider-cost reports.

A desktop workspace for coding agents

Kill Tony Archive

From long recordings to browsable data

A pipeline that turns long podcast recordings into transcripts and structured records, with a web interface for exploring the results.

I built separate transcription and analysis stages, transcript deduplication, and speaker normalization. The application adds rankings, voting, and shareable stat cards. The September 2026 local dataset contains 1,422 set records across 110 episodes.
